### PROBLEM

#### Gate EC Problem 9

Step 1. Flip a coin twice.

Step 2. If the outcomes are (TAILS, HEADS) then output Y and stop.

Step 3. If the outcomes are either (HEADS, HEADS) or (HEADS, TAILS), then output N and stop.

Step 4. If the outcomes are (TAILS, TAILS), then go to Step 1.

The probability that the output of the experiment is Y is (upto two decimal places) ...

### SOLUTION

Let flipping a coin twice be event H.

Sample space of event H = {HH, HT, TH, TT}

Let a random variable X;  $X_i = i$ , where  $i=1,2,3$ .

$X_1$  represents outcome {TT},

$X_2$  represents getting outcome {TH} or output Y,

$X_3$  represents getting output N.

The state transition matrix P is shown below :

$$\begin{matrix} & X_1 & X_2 & X_3 \\ \begin{matrix} X_1 \\ X_2 \\ X_3 \end{matrix} & \begin{bmatrix} \frac{1}{4} & \frac{1}{4} & \frac{1}{2} \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix} \end{matrix} \quad (0.0.1)$$

### Markov chain diagram

From the transition matrix, we have 1 transient state and 2 absorbing states.

$$Q = \begin{bmatrix} \frac{1}{4} \end{bmatrix} \text{ and } R = \begin{bmatrix} \frac{1}{4} & \frac{1}{2} \end{bmatrix}$$

$$N = (I - Q)^{-1} \quad (0.0.2)$$

$$= \left( [1] - \begin{bmatrix} \frac{1}{4} \end{bmatrix} \right)^{-1} \quad (0.0.3)$$

$$= \begin{bmatrix} \frac{4}{3} \end{bmatrix} \quad (0.0.4)$$

We know that probability of being absorbed by state j after starting in state i is given by the  $M_{i,j}$ , where  $M = NR$ .

$$M = \begin{bmatrix} \frac{1}{3} & \frac{2}{3} \end{bmatrix} \quad (0.0.5)$$

Hence the probability of being absorbed by state Y (1<sup>st</sup> element of R) after starting with state  $X_1$  (1<sup>st</sup> element of Q) is  $M_{1,1}$

$$\therefore \Pr(Y) = \frac{1}{3} = 0.33 \text{ (correct upto 2 decimal places).}$$

(0.0.6)
